ADMINISTRATIVE ACTION, JULY 11, 2025: Staff report amended with updated condition 1(a) to align with Virginia Housing (VH) lending requirements.

1. The Final Site Plan shall conform substantially with the preliminary plan dated November 22, 2022 and comply with the following conditions of approval.

   a. **If the Virginia Housing Development Authority or successor is the first lienholder of the permanent loan and if there is a foreclosure by the Virginia Housing Development Authority and it is the successful bidder and becomes the successor in interest, then the committed affordable housing units required may be reduced to no less than 20 percent of the originally approved units at 60 percent of the area median income for the Washington D.C. Metropolitan Statistical Area. Under no other circumstances will a reduction in the committed affordable units be allowed or considered. Refer to the letter/memo dated July 11, 2025 included with the site plan.**

CITY COUNCIL ACTION, FEBRUARY 25, 2023: City Council approved the Planning Commission recommendation.

PLANNING COMMISSION ACTION, FEBRUARY 7, 2023: On a motion by Commissioner Lyle, seconded by Vice Chair McMahon, the Planning Commission voted to recommend approval of Rezoning #2022-00008. The motion carried on a vote of 7 to 0.

On a motion by Commissioner Lyle, seconded by Vice Chair McMahon, the Planning Commission voted to approve Development Special Use Permit #2022-10022 and Special Use Permit #2022-00111, subject to all applicable codes and staff recommendations, and with revisions to Condition #101 as outlined in staff's February 7th memorandum to Planning Commission. The motion carried on a vote of 7 to 0.

Reason: The Planning Commission agreed with the staff analysis.

Commissioner Manor asked the applicant to further describe the objection to the Condition #101, including the revised version offered by staff. The applicant noted that the monetary contribution would contribute to a funding gap for the project. Commissioner Lyle expressed concern about requiring a developer contribution in advance of the adoption of the policy and considered whether she would support the inclusion of any version of the condition at all. She asked for developer contributions policies to be brought forward more quickly following adoption of a Small Area Plan.

Chair Macek expressed support for the project, including staff's recommended revisions to Condition #101. He noted that the revisions struck a good balance between the need for improved open space in the neighborhood (as expressed in the Small Area Plan) and the applicant's need for greater certainty about the contribution.

Vice-Chair McMahon also voiced her support for the project and for the revised Condition #101. She also stated that she had visited the site and noted the narrow width of Elbert Avenue and the presence of many vehicles on the street. Although not concerned about the provision of off-street parking as a part of this project, she encouraged staff to look into creative solutions to some of the existing vehicle-related issues neighbors have raised.

Commissioner Brown stressed the general importance of ensuring adequate public facilities, including schools, in connection with development projects.

Speakers:
Ingris Moran, representing Tenants and Workers United, spoke in support of the project and the provision of deeply-affordable housing units in general. She noted that the project represents an opportunity to live out the promise of the Arlandria-Chirilagua Small Area Plan.

Sandra Galeano, Elbert Avenue, expressed support for the proposal. She noted that she has lived in the neighborhood for 20 years and noted that everyone deserves an opportunity for affordable housing.

Mariela Raudales, Elbert Avenue, noted that she has lived in the City of Alexandria for 19 years and is currently a resident of the existing building at the site. She asked Planning Commission to support for the project, stating that she is looking forward to new housing given that the existing units have aged.

Lisa Lettieri, Community Lodgings Board member and resident of E. Nelson Avenue, spoke in support of the project.

Michael Dodson, Elbert Avenue, noted that he is one of the signatories of the August 2022 letter from neighbors expressing concerns about the project. He noted that he supports affordable housing and the Arlandria-Chirilagua Small Area Plan. He also expressed concern about the cumulative effect of development projects in the neighborhood. He appreciated the dialogue at community meetings and expressed disappointment that the neighborhood may not be eligible for some of the transportation-related solutions that have been discussed.

Mark Makary, Elbert Avenue, noted that he and other neighbors welcome new residents to the neighborhood but have traffic-related concerns. He asked for consideration of an extended "cut-back" or loading zone in front of the site to help prevent Elbert Avenue from being blocked by delivery vehicles.

Mary Catherine Gibbs, attorney representing the applicant, spoke in support. She stated that this project should be celebrated, particularly given its provision of deeply affordable housing. She noted that 16 emails of support have been forwarded to the Planning Commission and clarified that a loading zone is still being proposed along the frontage of the project site to help with delivery vehicles. She disagreed with the inclusion of Condition #101, noting that although the revised version contained in staff's February 7th memorandum is an improvement, her clients still object to the requirement of a developer contribution in advance of the adoption of a policy.

9. STAFF RECOMMENDATIONS

1. The Final Site Plan shall conform substantially with the preliminary plan dated November 22, 2022 and comply with the following conditions of approval.

   a. If the Virginia Housing Development Authority or successor is the first lienholder of the permanent loan and if there is a foreclosure by the Virginia Housing Development Authority and it is the successful bidder and becomes the successor in interest, then the committed affordable housing units required may be reduced to no less than 20 percent of the originally approved units at 60 percent of the area median income for the Washington D.C. Metropolitan Statistical Area. Under no other circumstances will a reduction in the committed affordable units be allowed or considered. Refer to the letter/memo dated July 11, 2025 included with the site plan.

I. SITE PLAN

minimum size storm sewer catch basin lead is 15-inches Acceptable pipe materials are Reinforced Concrete Pipe (RCP) ASTM C-76 Class IV. Alternatively, the Director of T&ES may approve AWWA C-151 (ANSI A21.51) Class 52. For roof drainage system, Polyvinyl Chloride (PVC) ASTM D-3034-77 SDR 26 and ASTM 1785-76 Schedule 40 pipes are acceptable. The minimum and maximum velocities are 2.0 fps and 15 fps, respectively. The storm sewers immediately upstream of the first manhole in the public right-of-way shall be owned and maintained privately (i.e., all storm drains not shown within an easement or in a public right-of-way shall be owned and maintained privately). (T&ES) *, ****

Acceptable pipe materials are Polyvinyl Chloride (PVC) ASTM D-3034-77 SDR 26, ASTM 1785-76 Schedule 40, Ductile Iron Pipe (DIP) AWWA C-151 (ANSI A21.51) Class 52, or reinforced concrete pipe ASTM C-76 Class IV (For 12-inches or larger diameters); Class III may be acceptable on private properties. Minimum and maximum velocities are 2.5 fps and 10 fps, respectively. Laterals shall be connected to the sanitary sewer through a manufactured "Y" or "T" or approved sewer saddle. Where the laterals are being connected to existing Terracotta pipes, replace the section of main and provide manufactured "Y" or "T", or else install a manhole. (T&ES) *, ****

F - 6. Provide a horizontal separation of 10-feet (edge to edge) between a storm or sanitary sewer and a water line. However, if this horizontal separation cannot be achieved, then install the sewer and water main in separate trenches and set the bottom of the water main at least 18-inches above of the top of the sewer. If both the horizontal and vertical separations cannot be achieved, then use Ductile Iron Pipe (DIP) AWWA C-151 (ANSI A21.51) Class 52 for the sewer pipe material and pressure test it in place without leakage prior to install. (T&ES) *, ****

F - 7. Provide at least 18-inches of vertical separation for sanitary sewer and 12-inches for storm sewer when a water main over crosses or under crosses a sanitary/storm sewer. However, if this cannot be achieved, then construct both the water main and the sanitary/storm sewer using Ductile Iron Pipe (DIP) AWWA C-151 (ANSI A21.51) Class 52 with joints that are equivalent to water main standards for a distance of 10-feet on each side of the point of crossing. Center a section of water main pipe at the point of crossing and pressure test the pipes in place without leakage prior to installation. Provide adequate structural support for sewers crossing over the water main (i.e., concrete pier support and/or concrete encasement) to prevent damage to the water main. Encase in concrete sanitary sewers under creeks and storm sewer pipe crossings with less than 6-inch clearance. (T&ES) *, ****

F - 8. No water main pipe shall pass through or touch any part of sanitary/storm sewer manhole. Place manholes at least 10-feet horizontally from the water main whenever possible. When local conditions prohibit this horizontal separation, ensure that the manhole is watertight and tested in place. (T&ES) *, ****

Subject: Compliance with Virginia Housing Affordability Requirements – Elbert Avenue Residences (DSUP #2022-10022)

Dear Ms. Sample,

Virginia Housing (VH) has a lending requirement that limits the level of affordability at VH-financed projects following the event of an incurable default where VH, as senior lender, assumes ownership and operation of the property. Alexandria City Council approved a zoning text amendment to the RMF zone (ZTA #2025-00004), implementing this change on June 14, 2025.

To align with these requirements, changes are required to DSUP #2022-10022. As such, Community Lodgings (CLI) will include the revised condition as part of its next final site plan submission to align the project with these changes

The change to the RMF language will be memorialized through the resubmitted final site plan which will include the addition of the condition below.

If the Virginia Housing Development Authority or successor is the first lienholder of the permanent loan and if there is a foreclosure by the Virginia Housing Development Authority and it is the successful bidder and becomes the successor in interest, then the committed affordable housing units required may be reduced to no less than 20 percent of the originally approved units at 60 percent of the area median income for the Washington D.C. Metropolitan Statistical Area. Under no other circumstances will a reduction in the committed affordable units be allowed or considered. Refer to the letter dated July 11, 2025 included with the site plan.

The first chart below identifies the project units that would be required to remain affordable under zoning requirements if Virginia Housing were to take the actions discussed above. Furthermore, the second chart includes the affordable units that are related to non-zoning requirements (i.e. approved by City Council).

SANITARY SEWER OUTFALL NARRATIVE

THE SUBJECT SITE IS CURRENTLY SERVED BY A SEPARATE SANITARY SEWER SYSTEM ACCORDING TO THE CITY OF ALEXANDRIA GIS SEWER VIEWER. THE SANITARY FLOW FROM THIS DEVELOPMENT SHALL CONNECT TO THE EXISTING SEWER NETWORK IN ELBERT AVENUE.

IT IS ANTICIPATED THAT THE SANITARY FLOW RESULTING FROM THIS DEVELOPMENT WILL BE APPROXIMATELY:

MULTIFAMILY RESIDENTIAL: 300 GPD x 91 UNITS = 27,300 GPD

27,300 GPD x 4 (PEAK FACTOR) = 109,200 GPD

THE EXISTING SANITARY FLOW FROM THIS SITE:

MULTIFAMILY RESIDENTIAL: 300 GPD X 29 UNITS = 8,700 GPD

8,700 GPD X 4 (PEAK FACTOR) = 34,800 GPD

NET: =74,400 GPD

BECAUSE THE PROPOSED DEVELOPMENT WILL RESULT IN AN INCREASE IN EXPECTED SANITARY SEWER FLOW MORE THAN 10,000 GPD, SANITARY SEWER OUTFALL ANALYSIS IS PROVIDED ON SHEET C-0901 IN ACCORDANCE WITH MEMO TO INDUSTRY NO. 06-14.

SANITARY TAP FEE CALCULATION

MULTIFAMILY DWELLING UNITS	91 UNITS X $9,773/UNIT =	$889,343

FLOODPLAIN COMPLIANCE

3908 ELBERT AVENUE
ALEXANDRIA, VA

INTRODUCTION

Wetland Studies and Solutions, Inc. (WSSI) provides this floodplain compliance summary regarding the property located at 3908 Elbert Avenue ("Site") located in the City of Alexandria ("City") (refer to Exhibit 1 for a Vicinity Map) to assist Community Lodgings, Inc. ("Client") in understanding floodplain compliance requirements for development in a regulatory floodplain. The Site conceptually involves the renovation of an existing building into a multi-level multi-unit residential building with associated multi-level parking.

SITE DESCRIPTION

The Site generally consists of one parcel with frontage along Elbert Avenue and bordered by surrounding developed parcels. The entire parcel is located partially within the 100-year regulatory floodplain associated with Four Mile Run, which is mapped as a Zone AE Special Flood Hazard Area (SFHA) on the FEMA Preliminary Flood Insurance Rate Maps[1] (FIRMs). The 100-year or base flood elevation (BFE) along Four Mile Run at the Site is listed as elevation 14.8 feet on the FIRM (Exhibit 2). The BFE at this location is dictated by a backwater condition controlled by the Alexandria East Levee. All flood elevation data provided on the effective FIRM and within the FIS are referenced to the North American Vertical Datum of 1988 (NAVD 88).

FLOODPLAIN REGULATIONS

The National Flood Insurance Program (NFIP) is a federal program created by Congress to mitigate future flood loses nationwide through sound, community-enforced building and zoning ordinances and to provide access to affordable, federally backed flood insurance protection for property owners. As a volunteer program, communities must elect to participate in the NFIP in order for the community and its residents to receive the benefits of the program. As a participant in the program, the community must develop and maintain their FIRMs, must adopt and enforce floodplain management ordinances and, ultimately, must ensure that all development, whether located within a regulatory floodplain or not, is reasonably safe from flooding. Minimum floodplain management requirements for participation in the NFIP are set forth in the Code of Federal Regulations at Title 44 CFR, Part 60.3. The City has elected to participate in the NFIP and has adopted more stringent floodplain regulations which are established by Section 6-300 ("Regulations") of their zoning ordinance.

[1] *FEMA Flood Insurance Rate Map, City of Alexandria, Virginia, Independent City, September 30, 2022.*

In accordance with the Regulations, proposed structures that meet the definition of new construction or substantial improvement that are located wholly or partially within the regulatory (100-year) floodplain must comply with the City's floodplain regulations. Substantial improvement is defined as the following:

> *Substantial improvement. Any repair, reconstruction, rehabilitation, addition or other improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the building or structure immediately before construction of the improvement is commenced, or any restoration of a building or structure which has incurred substantial damage.*

In addition, the regulations are further based on whether the structure is residential or non-residential, as residential properties carry a greater risk when located within a flood hazard zone. While both residential and non-residential structures are allowed to be constructed within the regulatory floodplain, Section 6-306 of the Regulations state the following:

> *6-306 Special Regulations*
>
> *Within the boundaries of any A or AE Zones in any floodplain district as shown on the Flood Insurance Rate Map, buildings or structures and their extensions and accessory buildings or structures may be constructed or substantially improved only in accordance with the following requirements of this Section 6-300 and all other applicable provisions of law.*
>
> *(A) The elevation of the lowest floor, including the basement, for any new residential building or any extension to a residential building shall be at least one foot above the base flood elevation.*
>
> *(B) The elevation of the lowest floor, including the basement for any new nonresidential building or structure and any extension or accessory to a nonresidential building shall be at least one foot above the base flood elevation. Nonresidential buildings located in all A or AE zones may be floodproofed in lieu of being elevated provided that all areas of the building components below the elevation corresponding to the base flood elevation plus one foot are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. In no event shall any floor below at least one foot above the base flood elevation be used for human or animal habitation, food storage or food preparation.*

For mixed-use buildings, Section 6-303(U) of the City's Regulations define the term mixed-use as the following:

> *Mixed-use building. Any building or structure that is used or intended for use for a mixture of nonresidential and residential uses in the same building or structure. For floodplain management purposes, a mixed-use building is subject to the same rules and conditions as a residential building unless all of the provisions set forth more specifically herein are met.*

Section 6-306 (K) of the Regulations provides conditions that must be met in order for a mixed use building to be considered as nonresidential by the City, as follows:

> *Any mixed-use building may be considered a nonresidential building for purposes of this Section 6-306 if all of the following conditions are met; otherwise, the building shall be considered a residential building:*
>
> *(1) No more than twenty percent of the development site is within the boundaries of any A or AE Zones in any floodplain district as shown on the Flood Insurance Rate Map;*
> *(2) At least 20,000 square feet of finished floor area of the proposed mixed-use building is devoted to nonresidential use;*
> *(3) Basement areas (including below grade parking) must be located outside the boundaries of any A or AE Zones in any floodplain district; and,*
> *(4) All floodproofing requirements specified in this Section 6-300 and as specified in FEMA Technical Bulletin 3-93 Non-Residential Floodproofing – Requirements and Certification must be met.*

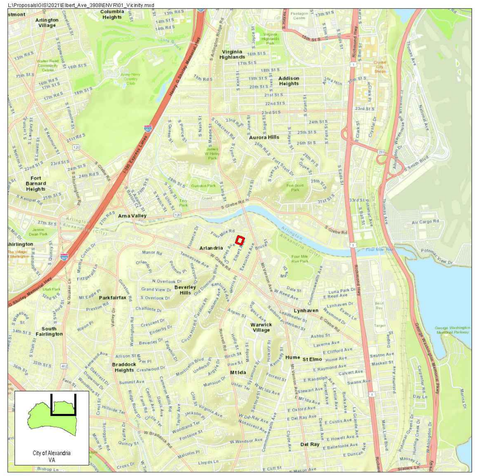
Because the site has more than 20% within the regulatory floodplain, the regulations treat any type of building on this site as residential. The following summarizes regulations that pertain to residential buildings constructed within a regulatory floodplain:

Design Flood Elevation (DFE):
The Design Flood Elevation (DFE) for any site required to comply with floodplain regulations is the 100-year flood elevation as obtained from the Flood Insurance Study (FIS) for the City of Alexandria with a 1-foot vertical buffer. For this site, the BFE is elevation 14.8 feet (NAVD 88) and therefore the DFE is 15.8 feet (NAVD 88).

Lowest Residential Floor Elevation: The elevation of the lowest floor, including basements and below grade parking garages, for any new residential building or any extension to a residential building shall be at or above the DFE. The only exception is for parking, storage or access with at least one side at or above ground elevation to allow flood waters to freely drain from those areas. Such areas must be Wet Floodproofed.

Floodproofing: Dry-Floodproofing is not permitted for residential buildings (such buildings must be elevated, except for parking, storage or access). Wet-Floodproofing must be provided for parking, storage or access located below the DFE for any residential structure and generally involve the following:

- all portions of the building below the DFE shall be constructed entirely of flood resistant materials



Wetland Studies and Solutions, Inc.
a DAVEY company

Exhibit 1

- parking, storage or access enclosures below the lowest residential floor must be designed to meet specific requirements to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. This generally requires the ground floor portion of the building to be open or, if enclosed, be fitted with sufficient flood vents to allow passage of water through the walls.

Utilities: All new and replacement public utilities, water mains and sanitary sewers shall be designed to minimize or eliminate infiltration and exfiltration and to ensure their structural integrity under flood conditions to the satisfaction of the Director. Water heaters, furnaces, electrical distribution panels and other critical mechanical or electrical installations shall not be installed below the base flood elevation and shall be dropped from above.

Structural Design: All of the building's structural components must be designed to resist flood related forces associated with a flood level up to the DFE. The building's foundation and walls will be designed to resist reasonably expected hydrostatic, buoyancy, hydrodynamic and debris impact forces associated with the flood levels up to the DFE. Any elevators servicing floors below the DFE must be designed in accordance with FEMA Technical Bulletin 4 – Elevator Installation.

SUMMARY

Due to the Site having greater than 20 percent located within the regulatory floodplain, it is anticipated that any substantial improvement associated with the existing building will be considered residential. As such, the lowest floor, except for parking, storage or access, must be elevated to at least the DFE or elevation 15.8 feet (NAVD 88). Any areas associated with parking, storage or access located below elevation 15.8 feet must be wet floodproofed. The building will need to be designed structurally to account for flood related forces associated with flooding up to elevation 15.8 feet and will need to meet requirements for protecting utilities.

If you have any questions or would like to discuss this in any further detail, please feel free to contact me at 703-679-5656 or via email at mmarsala@wetlands.com.

EXISTING SITE CONDITIONS:
THE SITE IS CURRENTLY COMPRISED OF A THREE (3) STORY APARTMENT BUILDING, SURFACE PARKING, AND LANDSCAPE AREAS. THE SITE DRAINS AWAY FROM SOUTHWEST TO NORTHEAST AND STORMWATER FLOWS OVERLAND TO THE ADJACENT PROPERTY OR ELBERT AVENUE WHERE IT ENTERS THE MUNICIPAL STORM SYSTEM INLETS WITHIN THE PUBLIC ROW.

CRITICAL AREAS:
THIS SITE IS LOCATED PARTIALLY WITHIN A 100-YEAR FLOODPLAIN.

ADJACENT PROPERTIES:
NORTH: MULTIFAMILY RESIDENTIAL BUILDING

EAST: ELBERT AVENUE & TOWNHOMES

SOUTH: TOWNHOMES

WEST: MULTIFAMILY RESIDENTIAL BUILDING

OFFSITE AREAS:
UTILITY SERVICE INSTALLATION.

EROSION AND SEDIMENT CONTROL MEASURES:

1. SEDIMENT AND EROSION CONTROL MEASURES ARE TO BE INSTALLED PRIOR TO GRADING.
2. SEDIMENT AND EROSION CONTROL MEASURES SHALL BE MAINTAINED UNTIL ALL GROUND DISTURBING ACTIVITY CEASES AND PERMANENT STABILIZATION OF ALL DISTURBED AREAS IS COMPLETE.
3. ALL STANDARDS AND SPECIFICATIONS REFER TO THE VIRGINIA EROSION AND SEDIMENT CONTROL HANDBOOK.

1.0 Description

1.1 This work shall consist of furnishing, placing, maintaining and removing the GutterGator sediment control device as directed by the engineer and as shown on the contract drawings. The GutterGator sediment control system manufactured by:

ACF Environmental, Inc.
2831 Cardwell Road
Richmond, Virginia 23234
Phone: 800-448-3636 • Fax: 804-743-7779

2.0 Materials

2.1 GUTTERGATOR

2.1.1 The GutterGator will be manufactured to 3' molds in 3', 6', 9', 12', 15' and 18' lengths and a minimum of twenty-four (24) inches longer than the curb inlet opening. This will allow for sufficient length to cover the inlet with twelve (12) inches beyond the inlet on both ends.

3.0 Construction Sequence

3.1 General

3.1.1 Install the GutterGator in front of the curb inlet opening. Drop 7lb weight sock into inlet opening, secure tie back straps, if applicable. Each end of the GutterGator should overlap the curb inlet approximately 12".

3.1.2 The GutterGator should be cleaned if a visual inspection shows sediment and debris build up around the GutterGator.

3.1.3 To remove the GutterGator, lift out of curb opening with provided carrying handle.

3.1.4 Clean as needed. Store out of direct sunlight.

3.1.5 Ponding is likely if sediment is not removed regularly. Inspection of GutterGator should be on a regular basis and immediately after wet weather events.

ADEQUATE OUTFALL ANALYSIS

CHANNEL PROTECTION:
THE SITE STORMWATER OUTFALLS INTO THE MUNICIPAL STORM SEWER SYSTEM WHERE IT IS ROUTED TO SUNNYSIDE STREAM, A NATURAL STREAM, AND THEN ULTIMATELY TO FOUR MILE RUN. SINCE A NATURAL CHANNEL IS WITHIN THE LIMITS OF ANALYSIS FOR CHANNEL PROTECTION (100X SITE AREA AS SHOWN ON THIS SHEET), THE DESIGN PARAMETERS OF Z.O. 13-109(F)(1)(C) FOR NATURAL STORMWATER CONVEYANCE SYSTEM HAVE BEEN UTILIZED IN ORDER TO COMPLY WITH THE CHANNEL PROTECTION REQUIREMENTS FOR EACH OUTFALL.

THE ALLOWABLE PEAK RELEASE FOR THE 1-YR, 24-HR STORM FOR THE SITE UNDER POST-DEVELOPMENT CONDITIONS HAS BEEN CALCULATED WITH THE FOLLOWING METHODOLOGY:

$$Q1\ POST \leq \frac{0.9\ (Q1\ PRE \times V1\ PRE)}{V1\ POST}$$

BASED ON THIS ANALYSIS, IT IS THE OPINION OF THE SUBMITTING ENGINEER THAT THE SITE COMPLIES WITH THE CHANNEL PROTECTION CRITERIA OUTLINED IN THE STATE STORMWATER REGULATIONS (9VAC25-870-66) AND ARTICLE XIII OF CITY OF ALEXANDRIA ZONING ORDINANCE.

FLOOD CONTROL:
THE STORMWATER CONVEYANCE SYSTEM FOR THE SITE ENTERS A MAPPED FLOODPLAIN WITHIN THE PROPERTY BOUNDARY, Z.O. 13-109(F)(2)(C)(III), AS THE PROPERTY PARTIALLY RESIDES WITHIN THE 100-YEAR FLOODPLAIN (SEE C-0401). PIPES WITHIN THE FLOOD CONTROL OUTFALL LIMITS ARE ADEQUATE FOR THE 10-YEAR 24 HOURS STORM. ADDITIONALLY, DETENTION WILL BE PROVIDED TO BRING THE POST-DEVELOPMENT FLOW RATES FOR THE 10-YEAR STORM TO PRE-DEVELOPMENT LEVELS.

BASED ON THIS, IT IS THE OPINION OF THE SUBMITTING ENGINEER THAT THE SITE COMPLIES WITH THE FLOOD PROTECTION CRITERIA OUTLINED IN THE STATE STORMWATER REGULATIONS (9VAC25-870-66) AND ARTICLE XIII OF CITY OF ALEXANDRIA ZONING ORDINANCE.

STORM DRAIN INLET MARKER

TO BE PLACED ON EVERY INLET ON SITE AND WITHIN 50 FT OF SUBJECT PROPERTY

STORMWATER MANAGEMENT & BEST MANAGEMENT PRACTICES NARRATIVE

EXISTING CONDITIONS:
THE SITE CURRENTLY CONSISTS OF AN EXISTING MULTIFAMILY BUILDING, CONCRETE WALKS, SHEDS, ASPHALT PAVEMENT, STREET TREES, AND ASSOCIATED UTILITY SERVICES. THE 38,467 SF (0.8831 AC.) SITE DRAINS FROM SOUTHWEST TO NORTHEAST TOWARD ELBERT AVENUE. STORMWATER THEN FLOW IN THE GUTTER PAN UNTIL IT ENTERS THE MUNICIPAL STORM SEWER SYSTEM VIA CURB INLETS LOCATED IN THE PUBLIC ROW. CURRENTLY, NO KNOWN STORMWATER CONTROLS EXIST ON-SITE. THE EXISTING DRAINAGE DIVIDES FOR THE SITE WILL GENERALLY BE MAINTAINED IN THE PROPOSED CONDITION. FOR THE PURPOSES OF STORMWATER MANAGEMENT, THE SITE AREA WILL BE THE LIMITS OF DISTURBANCE, EXCLUDING LINEAR UTILITY TRENCHING IN THE PUBLIC ROW, 42,946 SF OR 0.9859 ACRES.

PROPOSED CONDITIONS:
THE APPLICANT PROPOSES TO DEMOLISH THE EXISTING MULTIFAMILY BUILDING AND CONSTRUCT ONE (1) NEW MULTIFAMILY RESIDENTIAL BUILDING (HEIGHT UP TO 70 FEET) WITH A GROUND FLOOR PARKING GARAGE, EXTERIOR LOADING SPACE, SITE UTILITY INFRASTRUCTURE, AND STORMWATER MANAGEMENT FACILITIES.

STORMWATER QUALITY (SEE BMP SCHEMATIC – THIS SHEET):
IN ORDER TO COMPLY WITH ARTICLE 13 OF THE CITY OF ALEXANDRIA ZONING ORDINANCE AND THE VIRGINIA STATE WATER QUALITY REQUIREMENTS (9VAC25-870-63), THE SITE WILL INCLUDE LEVEL 1 BIO-RETENTION PLANTERS LOCATED IN THE REAR OF THE PROPOSED BUILDING AND A HYDRODYNAMIC SEPARATOR LOCATED IN THE NORTH SIDE YARD. THE PROPOSED BMPS WILL REDUCE PHOSPHORUS LEVELS AND COMPLY WITH ALL STATE AND CITY REQUIREMENTS. APPROXIMATELY 5,437 SF (18%) OF IMPERVIOUS AREA WITHIN THE PROPERTY BOUNDARY CANNOT BE CAPTURED AND TREATED DUE TO SITE AND GRADING CONSTRAINTS AND STRUCTURAL CONCERNS. THE WQV TREATMENT VOLUME FOR THIS IMPERVIOUS AREA WILL BE MITIGATED THROUGH PAYMENT INTO THE CITY OF ALEXANDRIA WATER QUALITY IMPACT FUND.

CHANNEL PROTECTION:
THE SITE STORMWATER OUTFALLS INTO THE MUNICIPAL STORM SEWER SYSTEM WHERE IT IS ROUTED TO SUNNYSIDE STREAM, A NATURAL STREAM, AND THEN ULTIMATELY TO FOUR MILE RUN. SINCE A NATURAL CHANNEL IS WITHIN THE LIMITS OF ANALYSIS FOR CHANNEL PROTECTION (100X SITE AREA AS SHOWN ON C-0703), DETENTION WILL BE PROVIDED FOR THE 1-YEAR 24-HOUR STORM BASED ON THE STATE ENERGY BALANCE EQUATION.

BASED ON THIS ANALYSIS, IT IS THE OPINION OF THE SUBMITTING ENGINEER THAT THE SITE COMPLIES WITH THE CHANNEL PROTECTION CRITERIA OUTLINED IN THE STATE STORMWATER REGULATIONS (9VAC25-870-66) AND ARTICLE XIII OF CITY OF ALEXANDRIA ZONING ORDINANCE.

FLOOD CONTROL:
THE STORMWATER CONVEYANCE SYSTEM FOR THE SITE ENTERS A MAPPED FLOODPLAIN WITHIN THE PROPERTY BOUNDARY, AS THE PROPERTY PARTIALLY RESIDES WITHIN THE 100-YEAR FLOODPLAIN (SEE C-0401). PIPES WITHIN THE OUTFALL LIMITS ARE ADEQUATE FOR THE 10-YEAR 24 HOURS STORM. ADDITIONALLY, DETENTION WILL BE PROVIDED TO BRING THE POST-DEVELOPMENT FLOW RATES FOR THE 10-YEAR STORM TO PRE-DEVELOPMENT LEVELS.

BASED ON THIS, IT IS THE OPINION OF THE SUBMITTING ENGINEER THAT THE SITE COMPLIES WITH THE FLOOD PROTECTION CRITERIA OUTLINED IN THE STATE STORMWATER REGULATIONS (9VAC25-870-66) AND ARTICLE XIII OF CITY OF ALEXANDRIA ZONING ORDINANCE.

ADJACENT PROPERTIES:
ALL UNCONTROLLED SHEET FLOW WILL BE NON-EROSIVE AND DIRECTED TOWARD ELBERT AVENUE RIGHT-OF-WAY AND INTO THE MUNICIPAL SEWER SYSTEM. THERE WILL NOT BE ANY ADVERSE IMPACT TO ADJACENT PROPERTIES AS A RESULT OF THIS PROJECT AND THE PROPOSED IMPROVEMENTS.

FLOODPLAIN BOUNDARY:
THIS SITE IS PARTIALLY LOCATED WITHIN THE 100-YEAR FLOODPLAIN BOUNDARY PER FEMA MAPS (SEE NARRATIVE ON C-0401A).

RESOURCE PROTECTION AREAS:
THERE ARE NO RESOURCE PROTECTION AREAS KNOWN TO EXIST ON THE SITE.

THE SITE RESIDES IN THE FOUR MILE RUN WATERSHED.

THE BMP FACILITIES WILL BE PRIVATELY OWNED AND MAINTAINED BY THE BUILDING OWNER/OPERATOR.

IMPERVIOUS AREA TO BIORETENTION (14,550 SQ. FT.)

AREA WITHIN LOD TO HYDRODYNAMIC SEPARATOR (INCLUDES REMAINING RUNOFF FROM BIO-RETENTION FACILITIES) (30,110 SQ. FT.)

AREA OUTSIDE LOD TO HYDRODYNAMIC SEPARATOR (NO CREDIT IN VRRM) (893 SQ. FT.)

***Notes (see below):**

[1] The curve numbers and runoff volumes computed in this spreadsheet for each drainage area are limited in their applicability for determining and demonstrating compliance with water quantity requirements. See VRRM User's Guide and Documentation for additional information.

[2] Runoff Volume (RV) for pre- and post-development drainage areas must be in volumetric units (e.g., acre-feet or cubic feet) when using the Energy Balance Equation. Runoff measured in watershed-inches and shown in the spreadsheet as RV(watershed-inch) can only be used in the Energy Balance Equation when the pre- and post-development drainage areas are equal. Otherwise RV(watershed-inch) must be multiplied by the drainage area.

[3] Adjusted CNs are based on runoff reduction volumes as calculated in D.A. tabs. An alternative CN adjustment calculation for Vegetated Roofs is included in BMP specification No. 5.

*SEE CHARTS BELOW FOR DIMENSION AND ELEVATION REFERENCES.

NOTES:

1. LENGTH (L) AND WIDTH (W) DIMENSIONS MUST BE A MINIMUM OF 2 FEET EACH.
2. NO STORAGE VOLUME CREDIT IS GIVEN FOR THE MULCH LAYER.
3. SEE VIRGINIA DEQ STORMWATER DESIGN SPECIFICATION NO. 9 FOR ADDITIONAL DESIGN AND CONSTRUCTION INFORMATION.
4. THE PLANTER BOX MAY BE CONTAINED IN A PRECAST CONCRETE, CAST-IN-PLACE CONCRETE OR 6"X6" PRESSURE TREATED WOOD VAULT. OTHER MATERIALS MAY INCLUDE MOLDED POLYPROPYLENE CELLS AND PRECAST MODULAR BLOCK SYSTEMS (VIRGINIA DEQ DESIGN SPECIFICATION NO. 9, SECTION 9-A-1).
5. SINCE PLANTER BOXES ARE LOCATED NEAR THE BUILDING FOUNDATION, WATERPROOFING BY USING A WATERTIGHT CONCRETE SHELL OR AN IMPERMEABLE LINER IS REQUIRED TO PREVENT SEEPAGE.
6. AN ATRIUM GRATE OR EQUIVALENT MAY BE USED FOR THE OVERFLOW ON TOP OF THE PVC STANDPIPE.
7. CONTRACTOR TO ENSURE THAT THE PROPER DOWNSPOUTS DISCHARGE INTO THE PLANTER BOX. A 1' X 1' X 0.5' (DEPTH) CONCRETE BOX (INTERIOR DIMENSIONS) FILLED WITH #2 STONE IS TO BE PROVIDED BELOW DOWNSPOUT DISCHARGE POINT FOR ENERGY DISSIPATION SHALL BE USED WHERE DOWNSPOUTS TIE INTO THE PLANTER BOX.
8. FOR PLANTER BOXES ATTACHED TO THE FOUNDATION AND/OR A RETAINING WALL, SEE ARCHITECTURAL PLANS FOR STRUCTURAL DETAILS/REQUIREMENTS.

PLANTER BOX MAINTENANCE

Planter Box Maintenance Schedule

Maintenance	Frequency
• Spot weeding, erosion repair, trash removal, and mulch raking	Twice during growing season
• Add reinforcement planting to maintain the desired vegetation density • Remove invasive plants using recommended control methods • Stabilize the contributing drainage area to prevent erosion	As needed
• Spring inspection and cleanup • Supplement mulch to maintain a 2-3 inch layer • Prune trees and shrubs • Examine for the ponding depth and adjust accordingly • Inspect inflows and overflow for erosion • Inspect for structural deficiencies and repair	Annually
• Remove sediment in pre-treatment cells and inflow points	Once every 2 to 3 years
• Replace the mulch layer	Every 3 years
• Inspected and certified by a professional licensed in the State of Virginia	Once every 5 years

NOTES

1. NOTE LEAF SCREENS TO BE INSTALLED AT ALL DOWNSPOUTS FOR PRETREATMENT PURPOSES.
2. ALL PROPOSED BMPS TO BE PRIVATELY OWNED AND MAINTAINED.
3. WALTER L. PHILLIPS, INC. DOES NOT PROVIDE BMP CERTIFICATIONS FOR NON-PROPRIETARY BMPS. A 3RD PARTY INSPECTOR MUST PREPARE AND CERTIFY A BMP CERTIFICATION FOR EACH URBAN BIO-RETENTION FACILITY PRIOR TO PROJECT CLOSEOUT.

Cascade Separator® Inspection and Maintenance Guide

CASCADE separator®

Maintenance

The Cascade Separator® system should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects sediment and debris will depend upon on-site activities and site pollutant characteristics. For example, unstable soils or heavy winter sanding will cause the sediment storage sump to fill more quickly but regular sweeping of paved surfaces will slow accumulation.

Inspection

Inspection is the key to effective maintenance and is easily performed. Pollutant transport and deposition may vary from year to year and regular inspections will help ensure that the system is cleaned out at the appropriate time. At a minimum, inspections should be performed twice per year (i.e. spring and fall). However, more frequent inspections may be necessary in climates where winter sanding operations may lead to rapid accumulations, or in equipment wash-down areas. Installations should also be inspected more frequently where excessive amounts of trash are expected.

A visual inspection should ascertain that the system components are in working order and that there are no blockages or obstructions in the inlet chamber, flumes or outlet channel. The inspection should also quantify the accumulation of hydrocarbons, trash and sediment in the system. Measuring pollutant accumulation can be done with a calibrated dipstick, tape measure or other measuring instrument. If absorbent material is used for enhanced removal of hydrocarbons, the level of discoloration of the sorbent material should also be identified during inspection. It is useful and often required as part of an operating permit to keep a record of each inspection. A simple form for doing so is provided in this Inspection and Maintenance Guide.

Access to the Cascade Separator unit is typically achieved through one manhole access cover. The opening allows for inspection and cleanout of the center chamber (cylinder) and sediment storage sump, as well as inspection of the inlet chamber and slanted skirt. For large units, multiple manhole covers allow access to the chambers and sump.

The Cascade Separator system should be cleaned before the level of sediment in the sump reaches the maximum sediment depth and/or when an appreciable level of hydrocarbons and trash has accumulated. If sorbent material is used, it must be replaced when significant discoloration has occurred. Performance may be impacted when maximum sediment storage capacity is exceeded. Contech recommends maintaining the system when sediment level reaches 50% of maximum storage volume. The level of sediment is easily determined by measuring the distance from the system outlet invert (standing water level) to the top of the sediment pile. To avoid underestimating the level of sediment in the chamber, the measuring device must be lowered to the top of the sediment pile carefully. Finer, silty particles at the top of the pile typically offer less resistance to the end of the rod than larger particles toward the bottom of the pile. Once this measurement is recorded, it should be compared to the chart in this document to determine if the height of the sediment pile off the bottom of the sump floor exceeds 50% of the maximum sediment storage.

Cleaning

Cleaning of a Cascade Separator system should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system. Simply remove the manhole cover and insert the vacuum tube down through the center chamber and into the sump. The system should be completely drained down and the sump fully evacuated of sediment. The areas outside the center chamber and the slanted skirt should also be washed off if pollutant build-up exists in these areas.

In installations where the risk of petroleum spills is small, liquid contaminants may not accumulate as quickly as sediment. However, the system should be cleaned out immediately in the event of an oil or gasoline spill. Motor oil and other hydrocarbons that accumulate on a more routine basis should be removed when an appreciable layer has been captured. To remove these pollutants, it may be preferable to use absorbent pads since they are usually less expensive to dispose than the oil/water emulsion that may be created by vacuuming the oily layer. Trash and debris can be netted out to separate it from the other pollutants. Then the system should be power washed to ensure it is free of trash and debris.

Manhole covers should be securely seated following cleaning activities to prevent leakage of runoff into the system from above and to ensure proper safety precautions. Confined space entry procedures need to be followed if physical access is required. Disposal of all material removed from the Cascade Separator system must be done in accordance with local regulations. In many locations, disposal of evacuated sediments may be handled in the same manner as disposal of sediments removed from catch basins or deep sump manholes. Check your local regulations for specific requirements on disposal. If any components are damaged, replacement parts can be ordered from the manufacturer.

Cascade Separator® Inspection & Maintenance Log

Cascade Model: Location:

Date	Depth Below Invert to Top of Sediment[1]	Floatable Layer Thickness[2]	Describe Maintenance Performed	Maintenance Personnel	Comments

1. The depth to sediment is determined by taking a measurement from the manhole outlet invert (standing water level) to the top of the sediment pile. Once this measurement is recorded, it should be compared to the chart in the maintenance guide to determine if the height of the sediment pile off the bottom of the sump floor exceeds 50% of the maximum sediment storage. Note: to avoid underestimating the volume of sediment in the chamber, the measuring device must be carefully lowered to the top of the sediment pile.
2. For optimum performance, the system should be cleaned out when the floating hydrocarbon layer accumulates to an appreciable thickness. In the event of an oil spill, the system should be cleaned immediately.

STORMWATER FACILITY INSPECTION CONSTRUCTION NOTES:

1. THE OWNER SHOULD BE AWARE THAT THE STORMWATER DETENTION AND WATER QUALITY FACILITIES ARE SUBJECT TO A MAINTENANCE AGREEMENT WITH THE LOCAL JURISDICTION COMMITTING THE OWNER TO PROPERLY CONSTRUCTING, INSPECTING, AND MAINTAINING THE FACILITIES. THE AGREEMENT DETAILS THE SPECIFIC INSPECTION AND MAINTENANCE REQUIREMENTS WHICH THE OWNER SHOULD BECOME FAMILIAR WITH.
2. THE OWNER IS REQUIRED TO OR SHOULD HAVE THE FACILITIES INSPECTED AND MAINTAINED ON AN ANNUAL BASIS. THE JURISDICTION MAY REQUIRE THE SUBMISSION OF REPORTS ON ALL INSPECTIONS AND MAINTENANCE ACTIVITIES.
3. THE LOCAL JURISDICTION IS REQUIRED UNDER VIRIGINIA REGULATIONS TO PERFORM THEIR OWN INSPECTION OF STORMWATER FACILITIES AT LEAST ONCE EVERY FIVE YEARS. THE JURISDICTION WILL NOTIFY THE OWNER OF ANY NOTED DEFICIENCIES, WHAT ACTIONS ARE REQUIRED, AND BY WHEN. THE MAINTENANCE AGREEMENT ALLOWS THE JURISDICTION TO CORRECT DEFICIENCIES, AT THE OWNER'S EXPENSE, IF THE OWNER FAILS TO DO SO WITHIN THE SPECIFIED TIMEFRAME.
4. THE OWNER SHOULD BE AWARE THAT NO ALTERATIONS ARE ALLOWED TO THE FACILITY WITHOUT PROCESSING A PLAN AND CONSTRUCTION PERMIT THROUGH THE JURISDICTION.

MAINTENANCE NOTES

1. ALL STORMWATER FACILITIES – INCLUDING CASCADE, DETENTION SYSTEM, AND PLANTER BOXES – ARE TO BE PRIVATELY OWNED AND MAINTAINED BY THE BUILDING OWNER/OPERATOR OR HOMEOWNER'S ASSOCIATION.

STORMWATER FACILITY CONSTRUCTION NOTES:

1. ALL STORMWATER MANAGEMENT AND WATER QUALITY FACILITIES WILL BE PRIVATELY OWNED AND MAINTAINED.
2. ALL STORMWATER FACILITIES SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE VIRGINIA DEQ SPECIFICATIONS AND LOCAL JURISDICTION'S REGULATIONS AND MANUALS. THIS INCLUDES MATERIALS, CONSTRUCTION METHODS AND SEQUENCE. IN THE EVENT OF A CONFLICT BETWEEN THE PLANS, DEQ OR LOCAL JURISDICTION, THE LOCAL JURISDICTION'S REQUIREMENTS SHALL GOVERN.
3. THE DETAILS FROM THE MANUFACTURER OF THE STORMWATER FACILITIES SHOWN ARE CURRENT AT THE TIME OF PLAN PREPARATION. THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING THE LATEST DETAILS PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL CONSTRUCT THE FACILITIES IN STRICT CONFORMANCE WITH THE MANUFACTURER'S RECOMMENDATIONS.
4. A PRE-CONSTRUCTION MEETING IS REQUIRED BETWEEN THE CONTRACTOR, STORMWATER FACILITY MANUFACTURER IF ANY, AND GEOTECHNICAL ENGINEER OF RECORD.
5. THE CONTRACTOR SHALL PROVIDE MATERIAL CERTIFICATIONS AND DELIVERY SLIPS AND A SIGNED CERTIFICATION THAT THE FACILITY WAS CONSTRUCTED IN ACCORDANCE WITH THESE PLANS.
6. THE INSTALLATION OF ALL STORMWATER DETENTION AND WATER QUALITY FACILITIES SHALL BE INSPECTED BY A LICENSED PROFESSIONAL IN ACCORDANCE WITH THE DEQ SPECIFICATIONS IF APPLICABLE AS WELL AS THE JURISDICTION'S REQUIREMENTS. THE CONTRACTOR IS RESPONSIBLE FOR COORDINATING WITH THE LICENSED PROFESSIONAL SELECTED BY THE OWNER TO ARRANGE FOR THE NECESSARY INSPECTIONS.
7. IF BEDROCK IS ENCOUNTERED, THE EXCAVATION FOR THE FACILITY SHALL EXTEND A MINIMUM OF 2' BELOW THE STORMWATER FACILITY INTO UNDERLYING BEDROCK OR AS RECOMMENDED BY THE GEOTECHNICAL ENGINEER OF RECORD.
8. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE PROTECTION AND MAINTENANCE OF THE STORMWATER FACILITIES AT LEAST UNTIL THE PROJECT IS SUBSTANTIALLY COMPLETE (UNLESS OTHERWISE SPECIFIED BY THE CONTRACTOR'S CONTRACT WITH THE OWNER).

NOTES

1. PIPE NETWORK OBTAINED FROM A MIX OF FIELD VERIFIED SURVEY BY WALTER L. PHILLIPS, INC. AND CITY OF ALEXANDRIA GIS/RECORD INFORMATION AND IS DEPICTED TO THE BEST OF THE ENGINEER'S KNOWLEDGE.
2. SEE THIS SHEET FOR PRELIMINARY SANITARY SEWER ADEQUATE OUTFALL NARRATIVE.
3. PIPE SIZE, LENGTH, SLOPE AND MATERIAL LISTED BASED ON A MIX OF FIELD SURVEY AND AVAILABLE CITY RECORDS.
4. THIS ANALYSIS IS PRELIMINARY AND WAS PREPARED USING A COMBINATION OF FIELD SURVEY, RECORD INFORMATION, AND CITY OF ALEXANDRIA GIS. ADDITIONAL ANALYSIS AND VERIFICATION OF DOWNSTREAM SEWER WITHIN THE LIMITS OF THIS STUDY WILL BE NECESSARY PRIOR TO THE TIME OF PRELIMINARY SITE PLAN SUBMISSION.
5. FOR THE PURPOSES OF THIS PRELIMINARY ANALYSIS, ASSUMPTIONS WERE MADE FOR SANITARY LATERAL CONNECTION LOCATION AND UNIT MIX IS BASED ON INFORMATION PROVIDED TO US AT THIS TIME.

SANITARY SEWER OUTFALL NARRATIVE

THE SUBJECT SITE IS CURRENTLY SERVED BY A SEPARATE SANITARY SEWER SYSTEM ACCORDING TO THE CITY OF ALEXANDRIA GIS SEWER VIEWER. THE SANITARY FLOW FROM THIS DEVELOPMENT SHALL CONNECT TO THE EXISTING SEWER NETWORK IN ELBERT AVENUE.

IT IS ANTICIPATED THAT THE SANITARY FLOW RESULTING FROM THIS DEVELOPMENT WILL BE APPROXIMATELY:

MULTIFAMILY RESIDENTIAL: 300 GPD x 91 UNITS = 27,300 GPD

27,300 GPD x 4 (PEAK FACTOR) = 109,200 GPD

THE EXISTING SANITARY FLOW FROM THIS STE:

MULTIFAMILY RESIDENTIAL: 300 GPD X 29 UNITS = 8,700 GPD

8,700 GPD X 4 (PEAK FACTOR) = 34,800 GPD

NET: =74,400 GPD

BECAUSE THE PROPOSED DEVELOPMENT WILL RESULT IN AN INCREASE IN EXPECTED SANITARY SEWER FLOW MORE THAN 10,000 GPD, SANITARY SEWER OUTFALL ANALYSIS IS REQUIRED IN ACCORDANCE WITH MEMO TO INDUSTRY NO. 06-14 WITH THE FUTURE DSUP APPLICATION.

DBH = Diameter at Breast Height (measured 4.5 feet above ground)

CRZ = Critical Root Zone - As determined by the corresponding jurisdiction

CRZ values for trees with multiple stems were calculated based on methods outlined in the 9th edition of the Guide for Plant Appraisal, published by the I.S.A.

Shared trees shall not be removed without written permission from adjacent property owners.

Offsite trees were assesd without trespassing. Measurements are approximate.

TABLE OF CONTENTS

I. GENERAL

A. Purpose

City of Alexandria, Code of Ordinances requires minimum fire flow that should be available for municipal firefighting. The fire flow requirements for buildings or portions of buildings and facilities to be determined in accordance with ISO Guide for Determination of Needed Fire Flow, 2014.

The purpose of the analysis is to provide the required Needed Fire Flow (NFF) calculations per ISO Guide and determine if the current public water supply is adequate.

B. Summary

Based on the required Needed Fire Water calculations, the public water supply is adequate for supplying the water required for firefighting.

II. APPLICABLE CODES

A. Fire Protection and Life Safety

1. 2021 Virginia Uniform Statewide Building Code – Amended International Building Code (IBC), 2021 Edition.
2. ISO Guide for Determination of Needed Fire Flow, 2014 Edition.
3. City of Alexandria, Code of Ordinances

III. BUILDING DESCRIPTION

A. General

The existing site is located at 3908 Elbert in Alexandria, Virginia. The proposed multifamily building consists of 6 stories including a parking garage included on the first floor. The lot faces Elbert Avenue on the east side and is neighbored by surrounding townhouses. The building will be equipped throughout with an automatic fire sprinkler system in accordance with NFPA 13. The building is proposed to be divided horizontally using a 3-hour rated fire wall separating the garage from the rest of the building. Furthermore, the residential building above will be divided into two sections by a fire wall. In accordance with 2021 Virginia Uniform Statewide Building Code, each portion of a building separated by one or more fire walls shall be considered a separate building. A public water supply including hydrants is available onsite.

B. Building Construction Type

In accordance with the development preliminary plan, the building(s) construction is classified as Type IIIA per IBC for the above residential building and Type IA for the parking garage.

Type IIIA construction consists of building elements of any material permitted by code including combustibles. The fire resistance rating is listed below:

	IA	IIIA
Building Elements:	Ratings (hr)	Ratings (hr)
Structural Frame	3	1
Bearing Walls Exterior	3	2
Bearing Walls Interior	3	1
Non-Bearing Walls Exterior	Based on building separation	Based on building separation
Floor	2	1
Roof	1.5	1

IV. NEEDED FIRE FLOW

A. Construction Factor (C)

To determine the portion of the NFF attributed to the construction and area of the selected building, ISO uses the formula:

$$C = 18F(\sqrt{A})$$

Where

A = effective area
F = Coefficient related to the class of construction:
F = 1.5 for Construction Class 1 (Frame)
F = 1.0 for Construction Class 2 (Joisted Masonry)
F = 0.8 for Construction Class 3 (Non-Combustible)
F = 0.8 for Construction Class 4 (Masonry Non-Combustible)
F = 0.6 for Construction Class 5 (Modified Fire Resistive)
F = 0.6 for Construction Class 6 (Fire Resistive)

The "F" coefficient is determined based on exterior walls, floors, and roof construction material and fire resistance rating. The residential buildings

above are classified as class IIIA construction in which the exterior walls are of noncombustible materials and the interior building elements are combustible. The exterior walls are 2-hour fire rated due to being bearing walls. The Coefficient related to the class of construction (F) is 1.

The parking garage is Type IA construction which is constructed with only noncombustible materials. The Coefficient to the class of construction (F) is 1.

The effective area includes the total square foot area of the largest floor in the building plus 50% of all other floors for buildings classified as Construction Class 1-4. For buildings classified as Construction Classes 5 or 6, calculate 25% of the area of not exceeding the two other largest floors if all vertical openings in the building are protected. Tally of effective area of the building is below:

Building 1	Largest Undivided (ft2)	50%
2	9202	9202
3	9202	4601
4	9202	4601
5	9202	4601
6	7594	3797
	Total	26802

Building 2	Largest Undivided (ft2)	50%
2	11889	11889
3	11889	5945
4	11889	5945
5	11889	5945
6	10467	5234
	Total	34956

Garage	Largest Undivided (ft2)	50%
garage	25268	25268
	Total	25268

The Construction Factor is calculated:

Buildings	F	A	Construction Factor C
Building 1	1	26802	2947
Building 2	1	34956	3365
Garage	0.8	25268	2289

B. Occupancy Factor (O)

The factors below reflect the influence of the occupancy in the subject building on the need fire flow:

Occupancy Combustibility Class	Occupancy Factor (O)
C-1 (Noncombustible)	0.75
C-2 (Limited Combustibility)	0.85
C-3 (Combustible)	1.00
C-4 (Free Burning)	1.15
C-5 (Rapid Burning)	1.25

Occupancies in the building are considered residential. It is not anticipated that merchandise or materials stored burn freely in the building. So, it is reasonable to classify the Occupancy Factor as C-2 Limited Combustible (**C=0.85**) due to residential occupancy.

C. Exposure and Communication Factors (X+P)

The factors developed in this item reflect the influence of adjoining and connected buildings on the needed fire flow.

The lot faces Elbert Ave to the east. No buildings are within 40 feet of the townhouse exterior walls on the sides facing the street.

The proposed construction is divided into 3 adjacent buildings, however the exposure factor is ruled out from adjacent buildings if the subject buildings are rated as habitational. The exposure factor is also excluded when subject buildings are rated as sprinklered. As such, the exposure factor is 0 for the 3 buildings.

D. Calculations

NFF = (C)(O)(1+(X+P))

Building 1	
Construction Factor C	2947
Occupancy Factor O	0.85
Exposure Factor (X+P)	0.000
NFF	2505

Building 2	
Construction Factor C	3365
Occupancy Factor O	0.85
Exposure Factor (X+P)	0.000
NFF	2861

Construction Factor C	2289
Occupancy Factor O	0.85

NEEDED FIRE FLOW (NFF) CONTINUED

PREPARED BY CAPITOL FPE LLC, DATED 07/29/2025

E. Sprinkler Reduction

City of Alexandria, Code of Ordinances permits the NFF to be reduced to 50% if the building is protected with automatic sprinkler system in accordance with NFPA 13, and a reduction of 33% for NFPA 13R sprinkler systems. Due to the building height, occupancy type, and areas, Virginia Uniform Statewide Building Code mandates the sprinkler protection per NFPA 13. As a result, the largest reduced NFF is listed below:

3908 Elbert Ave	13 (50%)
NFF (Sprinkler Reduction) BLDG 1	1252
NFF (Sprinkler Reduction) BLDG 2	1430
NFF (Sprinkler Reduction) Garage	973

V. CONCLUSION

Hydrant flow test was performed on July 3rd, 2024. The residual hydrant (#3068 is located at the corner of Elbert Avenue and W Glebe Rd. The flow hydrant (#3067) recorded 1706 GPM at residual pressure of 20 PSI.

The maximum calculated NFF is 1,430 GPM, and the available public water supply is 1706 GPM. Based on the calculation result of 1,430 GPM NFF, the public water supply is adequate for firefighting purposes.

EXECUTIVE SUMMARY

The following summarizes the main findings of the exploration, particularly those that may have a cost impact on the planned development. Further, our principal foundation recommendations are summarized. This Executive Summary is intended as a very brief overview of the primary geotechnical conditions that are expected to affect design and construction. Information gleaned from the executive summary should not be utilized in lieu of reading the entire geotechnical report.

- Based on our geotechnical exploration, the proposed residential building can be supported by conventional shallow foundations consisting of spread/wall footings bearing on natural soils (Stratum II or verified Stratum I soils) with an allowable capacity of 4,000 psf.
- Most of the soils at the foundation bearing elevation appear to be undocumented fill material placed during previous site development and local construction activities. Although this material is old fill that was placed, previous structures have been constructed on this material. However, the consistency of this fill soil cannot be quantified and there may be some localized areas that are loose or may encounter some previous trace organics and/or construction debris. Therefore, during construction there could be localized areas that will require undercutting and replacement
- Most of the on-site materials may be reused as engineered fill provided that they do not contain organics or foreign debris, are not highly plastic, are not environmentally impacted, and conform to the criteria outlined herein.
- For pavement sections, we recommend a preliminary design CBR value of 4.

4.0 DESIGN RECOMMENDATIONS

4.1 FOUNDATIONS

Provided subgrades are prepared as recommended in this report, the proposed structure can be supported by shallow foundations including column footings and continuous wall footings. We recommend the foundation design use the following parameters:

Table 4.1.1 Foundation Re commendations

Design Parameter	Column Footing	Wall Footing
Net Allowable Bearing Pressure(1)	4,000 psf	4,000 psf
Acceptable Bearing Soil Material	Stratum II (or Verified Stratum I) – Loose to Medium Dense Soil	
Minimum Footing Embedment Depth (below slab or finished grade)(2)	**36 inches**	**36 inches**
Minimum Footing Width	36 inches	24 inches
Estimated Total Settlement(3)	Less than 1 inch	Less than 1 inch
Estimated Differential Settlement(4)	Less than 0.5 inches	Less than 0.5 inches
Provided Estimated Column Loads	700 kips	10 klf

Notes:
(1) Net allowable bearing pressure is the applied pressure in excess of the surrounding overburden soils above the base of the foundation.
(2) Minimum embedment required for soil bearing considerations.
(3) Based on assumed structural loads. If final loads are different, ECS must be contacted to update foundation recommendations and settlement calculations.
(4) Based on maximum column/wall loads and variability in borings. Differential settlement can be re-evaluated once the foundation plans are more complete.

Please note that approximately 4.5 feet to 8 feet of old fill soils were encountered within the borings, with the majority being around 4.5 feet below existing grades. This area of the site has been previously developed with existing buildings and the topography has been raised in this part of Alexandria over hundreds of years. Although this material is old fill that was placed, previous structures have been constructed on this material. However, the consistency of this fill soil cannot be quantified and there may be some localized areas that are loose or may encounter some previous trace organics and/or construction debris. Therefore, during construction there could be localized areas that will require undercutting and replacement as detailed in the Potential Undercuts section below. An allowance for up to 3 feet undercut and replacement should be considered in the final construction budget.

During construction, the bearing capacity at the final footing elevations should be tested in the field by the Geotechnical Engineer of Record (GER) or their authorized representative to document that the in-situ bearing capacity at the bottom of each footing excavation is adequate for the design loads and confirm that any undocumented fill material is suitable for the allowable bearing capacity or has been removed and replaced as noted below.

Potential Undercuts: Most of the soils at the foundation bearing elevation appear to be undocumented fill material placed during previous construction activities. These fill materials are not suitable for the support of the proposed foundations as the manor of placement and compaction is unknown. These materials should be undercut and replaced. If soft or unsuitable soils are observed at the footing bearing elevations, the unsuitable soils should be undercut and removed. Any undercut should be lean cut and backfilled with lean concrete ($f'_c \geq 1,000$ psi at 28 days) up to the original design bottom of footing elevation; the original footing shall be constructed on top of the hardened lean concrete.

4.2 SLABS ON GRADE

Structural fill material will need to be compacted in order to reach the proposed finished floor elevation of EL. +16.0 feet. In some areas across the site, fill areas will extend up to ±4 feet. We recommend heavy proofrolling of the subgrade soils with a loaded dump truck in order to identify any soft areas.

The on-site natural soils are considered suitable for support of the lowest floor slabs when compacted, although moisture control during earthwork operations, including the use of discing or appropriate drying equipment, may be necessary. Any areas of soft or yielding soils should be removed and replaced with compacted structural fill in accordance with the recommendations included in this report. The following graphic depicts our soil-supported slab recommendations:

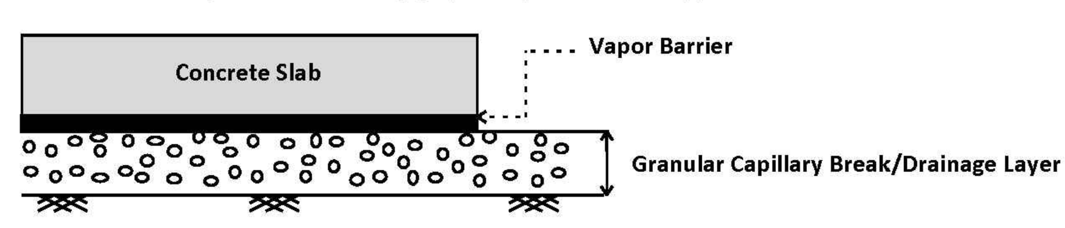

Figure 4.2.1

1. Drainage Layer Thickness (Below Grade Parking): 6 inches
2. Drainage Layer Thickness (At Grade Footprint): 6 inches
3. Drainage Layer Material: VDOT #57 stone
4. Subgrade proofrolled or compacted to 95% maximum dry density per ASTM D698

Subgrade Modulus: Provided the placement of Structural Fill and Granular Drainage Layer per the recommendations discussed herein, the slab may be designed assuming a modulus of subgrade reaction, k_1 of 100 pci (lbs/cu. inch). The modulus of subgrade reaction value is based on a 1 ft by 1 ft plate load test basis.

Vapor Barrier: Before the placement of concrete, a vapor barrier may be placed on top of the granular drainage layer to provide additional protection against moisture penetration through the floor slab. When a vapor barrier is used, special attention should be given to surface curing of the slab to reduce the potential for uneven drying, curling and/or cracking of the slab. Depending on

proposed flooring material types, the structural engineer and/or the architect may choose to eliminate the vapor barrier.

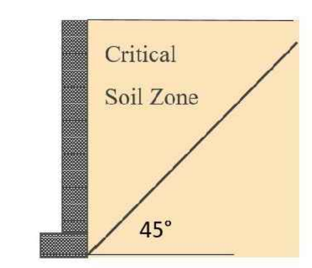
Slab Isolation: Soil-supported slabs should be isolated from the foundations and foundation-supported elements of the structure so that differential movement between the foundations and slab will not induce excessive shear and bending stresses in the floor slab. Where the structural configuration prevents the use of a free-floating slab such as in a drop-down footing/monolithic slab configuration, the slab should be designed with suitable reinforcement and load transfer devices to preclude overstressing of the slab.

4.3 SITE RETAINING WALLS

Site retaining walls are free to rotate at the top (not restrained). For these walls the "Active" (k_a) soil condition should be used along with a triangular distribution of earth pressures. In addition, site retaining walls should be designed to withstand lateral earth pressures exerted by the backfill and any surcharge loads within the "Critical Soil Zone". The Critical Zone is defined as the area between the back of the retaining wall footing and an imaginary line projected upward and rearward at a 45-degree angle (see figure below).

The lateral earth pressures developed behind site retaining walls are a function of the backfill soil type, backfill slope angle, and any surcharge loads. For the design of site retaining walls, we recommend the soil parameters provided below.

RETAINING WALL BACKFILL IN THE CRITICAL SOIL ZONE	
Soil Parameter	**Estimated Value**
Soil Classification	Silt (ML) or more granular
Coefficient of Active Earth Pressure (K_a)	0.33
Retained Soil Moist Unit Weight (γ)	115 pcf
Cohesion (C)	0 psf
Angle of Internal Friction (ϕ)	30°
Active Equivalent Fluid Pressure	38H (psf)



Soil Parameter	Estimated value
Allowable Net Soil Bearing Pressure	2,000 psf
Soil Moist Unit Weight (γ)	115 pcf
Cohesion (C)	0 psf
Sliding Friction Coefficient [Concrete on Soil] (μ)	0.33

It is critical that the soils used for backfilling of the retaining walls meet the soil parameters recommended above. If the soils available do not meet those parameters, then ECS should be contacted to provide revised values, and to confirm that only suitable soils will be used for wall backfill.

Care should be used to avoid the operation of heavy equipment to compact the wall backfill since it may overload and damage the wall. In addition, such loads are not typically considered in the design of site retaining walls and are not provided for in our recommendations.

Wall Drains: Retaining walls should be provided with a wall and foundation drainage system so that hydrostatic pressures do not build up behind the walls. This system should consist of weepholes through the wall and/or a 4-inch perforated, closed joint drain line located along the backside of the walls above the top of the footing. The drain line should be surrounded by a minimum of 6 inches of AASHTO #57 Stone wrapped with an approved non-woven geotextile, such as Mirafi 140-N or equivalent. Wall drains can consist of a 12-inch-wide zone of free draining gravel, such as AASHTO #57 Stone, employed directly behind the wall and separated from the soils beyond with a non-woven geotextile. Alternatively, the wall drain can consist of a suitable geocomposite drainage board material. The wall drain should be hydraulically connected to the foundation drain.

4.4 STORMWATER MANAGEMENT FACILITIES

A stormwater management detention vault with approximate dimensions of 145 feet in length and 6 feet in width, is proposed along the northern side of the site and bio-planters are proposed along the eastern side of the proposed building. We have not been provided with invert elevations for the various stormwater facilities. However, we understand that these facilities are not anticipated to infiltrate.

The below grade structure for the water storage vault should be designed to withstand lateral earth pressures and surcharge loads. We recommend that walls that are restrained from movement at the top be designed for a linearly increasing "at rest" lateral earth pressure of 60H. The wall design should also account for any surcharge loads imposed within a 45-degree slope of the base of the wall. The influence of these surcharge loads on the below grade walls should be based on an at-rest pressure coefficient, k_0, of 0.33 in the case of restrained walls.

4.5 SEISMIC DESIGN CONSIDERATIONS

The Commonwealth of Virginia has adopted Virginia Construction Code 2021 (VCC) via the Virginia Uniform Statewide Building Code (USBC). The current version of VCC incorporates ASCE 7-22, Minimum design Loads and Associated Criteria for Building and Other Structures into the building code. This adoption supersedes Section 16 of IBC 2021, in respect to seismic site classification.

ASCE 7-22, Chapter 20 has updated the procedure for determining Site Classification. This chapter requires that site classification be conducted based on the average shear wave velocity of the top 100 feet of the site. The shear velocity can either be measured or estimated based on established correlations. If site classification is based on estimated values of shear wave velocity (v_s) the site class shall be derived using V_s, $V_s/1.3$ and $V_s(1.3)$. The seismic site class definitions for the weighted average shear wave velocities in the upper 100 feet of the soil profile are presented in Chapter 20 of ASCE 7-22 and in the table below.

Table 4.4.1: Seismic Site Classification

Site Class	Soil Profile Name	Shear Wave Velocity, Vs, (ft./s)
A	Hard Rock	Vs > 5,000 ft./s
B	Rock	>3,000 to 5,000 ft./s
BC	Soft Rock	>2,100 to 3,000 ft./s
C	Very Dense Sand or Hard Clay	>1,450 to 2,100 ft./s
CD	Dense Sand or Very Stiff Clay	>1,000 to 1,450 ft./s
D	Medium Dense Sand or Stiff Clay	>700 to 1,000 ft./s
DE	Loose Sand or Medium Stiff Clay	>500 to 700 ft./s
E	Very Loose Sand of Soft Clay	Vs < 500 ft./s

In this project, shear wave velocity of the soil profile was estimated based on the soil densities and type observed. Based upon our estimate and assumed proposed bearing elevations of the structures we recommend that a **Site Classification of D** be used for the structures. This site Classification is based on a Risk Category of II for the building. This recommendation is in accordance with the procedure outlined in ASCE 7-22. It is worth noting that if this project is submitted under a different code year an alternate soil site classification may be appropriate. We should be notified if this project is being submitted for design under VCC 2018 (IBC-2018 or ASCE 7-16).

4.6 PAVEMENTS

For the design and construction of exterior pavements, we recommend that topsoil and any other soft or unsuitable materials be removed from the area to be paved extending to a limit 5 feet beyond the back of curb or edge of shoulder. The stripped surface should be proofrolled and carefully observed at the time of construction in order to aid in identifying the localized soft or unsuitable materials, which should be removed.

Based on the soils encountered during our borings performed across the site we recommend a preliminary design CBR value of 4 where CBR samples will be required within the upper 12 inches of the subgrade soils during construction. This value should be used in the design of the pavements and the CBR results obtained either prior to or during construction should be used to evaluate this design. If the results of the CBR tests taken prior to or during construction differ from the recommended value mentioned above, the pavement design should be modified as necessary. Please note the silt soils in the area of the site are weak and degrade easily when wet. Typical CBR values are generally lower than similar soils in other parts of the City of Alexandria.

5.0 CONSTRUCTION RECOMMENDATIONS

5.1 SUPPORT OF EXCAVATION

5.1 TEMPORARY DEWATERING

The contractor shall make their own assessment of temporary dewatering needs based upon the limited subsurface groundwater information presented in this report. Soil sampling is not continuous, and thus soil and groundwater conditions may vary between sampling intervals (typically 5 feet). If the contractor believes additional subsurface information is needed to assess dewatering needs, they should obtain such information at their own expense. ECS makes no warranties or guarantees regarding the adequacy of the provided information to determine dewatering requirements; such recommendations are beyond our scope of services.

Dewatering systems are a critical component of many construction projects. Dewatering systems must be selected, designed, and maintained by a qualified and experienced (specialty or other) contractor familiar with the succinct geotechnical and other aspects of the project. The failure to properly design and maintain a dewatering system for a given project can result in delayed construction, unnecessary foundation subgrade undercuts, detrimental phenomena such as 'running sand' conditions, internal erosion (i.e., 'piping'), the migration of 'fines' down-gradient towards the dewatering system, localized settlement of nearby infrastructure, foundations, slabs-on-grade and pavements, etc. Water discharged from any site dewatering system shall be discharged in accordance with all local, state and federal requirements.

Strategies for Addressing Perched Groundwater:

The typical primary strategy for addressing perched groundwater seeping into excavations is pumping from trench (or French) and sump pits with sump pumps. A typical sump pump drain (found in a sump pit or along a French drain) is depicted below. The inlet of the sump pump is placed at the bottom of the corrugated pipe and the discharge end of the sump is directed to an appropriate stormwater drain.

GEOTECHNICAL REPORT SUMMARY

BELOW IS AN EXCERPT SUMMARY OF THE GEOTECHNICAL ENGINEERING REPORT; PREPARED BY ECS MID-ATLANTIC, LLC AND DATED MARCH 27, 2025. (SUBMITTED TO SATISFY THE GEOTECHNICAL REPORT REQUIREMENT OF THE SITE PLAN CONDITIONS). PLEASE REVIEW THE ENTIRE REPORT AS PROVIDED TO THE CITY OF ALEXANDRIA.

Details of a typical French drainage installation are included in Appendix D. A typical French drain consists of an 18 to 24-inch wide by 18 to 24-inch deep bed of AASHTO #57 (or similar open graded aggregate) aggregate wrapped in a medium duty, non-woven geotextile and (sometimes) containing a 6-inch diameter, Schedule 40 PVC perforated or slotted pipe. Actual dimensions should be as determined necessary by ECS during construction. After the installation has been completed, the geotextile should be wrapped over the top of the aggregate and pipe followed by placement of backfill. The top of the drain should be positioned at least 18 inches below the design subgrade elevations. Drains should not be routed within the expanded building limits.

5.2 SUBGRADE PREPARATION

5.2.1 Demolition

Initial preparation of the site should consist of complete removal of the existing foundations, pavements, sidewalks, and utilities that will not be part of the new construction. Demolition of the existing building should include the complete removal of all foundations and slabs.

5.2.2 Stripping and Grubbing

After stripping to the desired grade and performing all necessary removal of any existing fills, the exposed soils should be carefully examined to identify any localized loose, yielding or otherwise unsuitable materials by an experienced geotechnical engineer or his authorized representative. Any soft or unsuitable materials encountered during this proofrolling should be removed and replaced with an approved backfill compacted to the criteria given below in the section entitled Fill Placement.

The preparation of fill subgrades should be observed on a full-time basis. These observations should be performed by an experienced geotechnical engineer, or his representative, to document that all unsuitable materials have been removed, and that the subgrade is suitable for support of the proposed construction and/or fills. In some areas, excessively soft and/or wet soils may be encountered for fill subgrades, especially in the winter or early spring months. Soil bridging lifts should not be used to span over soft fill subgrade soils within the expanded building limits. All soft areas shall be excavated and removed.

5.2.3 Proofrolling

Prior to fill placement or other construction on subgrades, the subgrades should be evaluated by a qualified testing agency. The exposed subgrade should be thoroughly proofrolled with construction equipment having a minimum axle load of 10 tons [e.g. fully loaded tandem-axle dump truck] or heavy wheeled equipment if not accessible for a dump truck. Proofrolling should be traversed in two perpendicular directions with overlapping passes of the vehicle under the observation of a qualified representative. This procedure is intended to assist in identifying any localized yielding materials.

Where proofrolling identifies areas that are unstable or "pumping" subgrade those areas should be repaired prior to the placement of any subsequent Structural Fill or other construction materials. Methods of stabilization include undercutting, moisture conditioning, or chemical

stabilization. The situation should be discussed with ECS to determine the appropriate procedure. Test pits may be excavated to explore the shallow subsurface materials to help in determining the cause of the observed unstable materials, and to assist in the evaluation of appropriate remedial actions to stabilize the subgrade.

5.3 EARTHWORK OPERATIONS

5.3.1 Structural Fill Materials

Fill Content: Existing fill was encountered in some borings with the deepest areas of fill up to 7+ feet below existing site grades. Deleterious materials such as brick was encountered in some of the existing fill soils. Granular fill (Silty SAND (SM)), that is free of man-made material and organic debris may be suitable for re-use as Structural Fill; however, further testing will be required. Highly plastic soils are not suitable for use as structural fill at the site.

Product Submittals: Prior to placement of Structural Fill, representative bulk samples (about 50 pounds) of on-site and off-site borrow should be submitted to ECS for laboratory testing, which will include Atterberg limits, natural moisture content, grain-size distribution, and moisture-density relationships for compaction. Import materials should be tested prior to being hauled to the site to determine if they meet project specifications.

Satisfactory Structural Fill Materials: Materials satisfactory for use as Structural Fill should consist of inorganic soils with the following engineering properties and compaction requirements.

STRUCTURAL FILL INDEX PROPERTIES	
Subject	**Property**
Building and Pavement Areas	LL < 40, PI<20
Max. Particle Size	4 inches
Max. organic content	5% by dry weight

STRUCTURAL FILL COMPACTION REQUIREMENTS	
Subject	**Requirement**
Compaction Standard	Standard Proctor, ASTM D698
Required Compaction	-95% of Max. Dry Density -98% of Max. Dry Density for fills greater than 8'
Moisture Content	-2 to +3 % points of the soil's optimum value
Loose Thickness	8 inches prior to compaction (4 inches if utilizing hand operated compaction equipment)

Unsatisfactory Materials: Unsatisfactory fill materials include materials which to not satisfy the requirements for suitable materials, as well as topsoil and organic materials (OH, OL), elastic Silt (MH), and high plasticity Clay (CH). Such materials, if encountered during grading operations,

should be removed and either stockpiled for later use in landscape fills, or placed in approved disposal areas either on site or off site.

On-Site Soils: Most of the on-site materials may be reused as engineered fill if they do not contain organics or foreign debris, are not highly plastic, are not environmentally impacted, and conform to the criteria outlined above. Based on observations made during the subsurface exploration program and following visual observation of the recovered soil samples, most of the natural soils underlying the existing fill are expected to be suitable for reuse as engineered fill materials. During excavation operations localized layers of highly plastic soils may be encountered. These soils are not suitable for use as structural fill on site. Moisture adjustment is anticipated to be required to condition any suitable on-site material before its placement in new structural fill areas. The suitability of the existing fill soils for reuse as engineered fill should be further evaluated in the field at the time of construction. Any fill placed beneath proposed footings designed for greater than 3,000 psf should only consist of lean concrete.

5.4 FOUNDATION AND SLAB OBSERVATIONS

Protection of Foundation Excavations: Exposure to the environment may weaken the soils at the footing bearing level if the foundation excavations remain open for too long a time. Therefore, foundation concrete should be placed the same day that excavations are made. If the bearing soils are softened by surface water intrusion or exposure, the softened soils must be removed from the foundation excavation bottom immediately prior to placement of concrete. If the excavation must remain open overnight, or if rainfall becomes imminent while the bearing soils are exposed, a 1 to 3-inch thick "mud mat" of "lean" concrete should be placed on the bearing soils before the placement of reinforcing steel.

Footing Subgrade Observations: Most of the soils at the foundation bearing elevation are anticipated to be suitable for support of the proposed structure. It is important to have ECS observe the foundation subgrade prior to placing foundation concrete, to confirm the bearing soils are what was anticipated.

Slab Subgrade Verification: Prior to placement of a drainage layer, the subgrade should be prepared in accordance with the recommendations found in **Section 5.2.3 Proofrolling**.

5.5 UTILITY INSTALLATIONS

Utility Subgrades: The soils encountered in our exploration are expected to be generally suitable for support of utility pipes. The pipe subgrades should be observed and probed for stability by ECS. Any loose or unsuitable materials encountered should be removed and replaced with suitable compacted Structural Fill, or pipe stone bedding material.

Utility Backfilling: The granular bedding material (often AASHTO #57 stone) should be at least 4 inches thick, but not less than that specified by the civil engineer's project drawings and specifications. We recommend that the bedding materials be placed up to the spring line of the pipe. Fill placed for support of the utilities, as well as backfill over the utilities, should satisfy the requirements for Structural Fill and Fill Placement.

Excavation Safety: All excavations and slopes should be constructed and maintained in accordance with OSHA excavation safety standards. The contractor is solely responsible for designing, constructing, and maintaining stable temporary excavations and slopes. The contractor's responsible person, as defined in 29 CFR Part 1926, should evaluate the soil exposed in the excavations as part of the contractor's safety procedures. In no case should slope height, slope inclination, or excavation depth, including utility trench excavation depth, exceed those specified in local, state, and federal safety regulations. ECS is providing this information solely as a service to our client. ECS is not assuming responsibility for construction site safety or the contractor's activities; such responsibility is not being implied and should not be inferred.

6.0 CLOSING

ECS has prepared this report to guide the geotechnical-related design and construction aspects of the project. We performed these services in accordance with the standard of care expected of professionals in the industry performing similar services on projects of like size and complexity at this time in the region. No other representation expressed or implied, and no warranty or guarantee is included or intended in this report.

The description of the proposed project is based on information provided to ECS by Joseph Browne Development Associates. If any of this information is inaccurate or changes, either because of our interpretation of the documents provided or site or design changes that may occur later, ECS should be contacted so we can review our recommendations and provide additional or alternate recommendations that reflect the proposed construction.

We recommend that ECS review the project plans and specifications so we can confirm that those plans/specifications are in accordance with the recommendations of this geotechnical report.

Field observations, and quality assurance testing during earthwork and foundation installation are an extension of, and integral to, the geotechnical design. We recommend that ECS be retained to apply our expertise throughout the geotechnical phases of construction, and to provide consultation and recommendation should issues arise.

ECS is not responsible for the conclusions, opinions, or recommendations of others based on the data in this report.

10.0 FINDINGS AND CONCLUSIONS

10.1 Findings and Opinions

ECS Mid-Atlantic, LLC (ECS) was contracted by Community Lodgings, Inc. to perform an ASTM E1527-21, Phase I Environmental Site Assessment (ESA) of the Elbert Apartments Property located at 3908-3916 Elbert Avenue in Alexandria, City of Alexandria, Virginia (i.e. subject property).

The subject property is identified by the City of Alexandria as Map-Block-Lot Number 007.01-04-04 and owned by CLI Multifamily Partnership LP. The 0.86-acre subject property is developed with three apartment buildings containing 28 residential units. The apartment buildings were constructed in 1940 and contain 23,652 square feet of space. A maintenance shop is located in the 3912 Elbert Avenue building. The maintenance shop contains a natural gas water heater and maintenance chemicals. The buildings are heated with electricity and are provided with water and sanitary sewer services by Virginia American Water.

The exterior of the subject property consists of asphalt-paved parking areas, landscaped areas, storage sheds, and a playground area. The subject property gently slopes to the northeast. The storage sheds contain property files, maintenance parts, and some landscaping equipment. Two one-gallon containers of gasoline and oil were observed within one of the sheds, and staining was not observed in the vicinity of the containers. Several solid waste dumpsters are located in the vicinity of the apartment buildings. One pad-mounted transformer was observed at the subject property. The transformer is owned and maintained by Dominion Energy. We did not observe evidence of leakage or staining in the vicinity of the transformer.

The subject property is located in a residential area of Alexandria, Virginia. Based on our review of site topography and conditions observed during the site reconnaissance, it is our professional opinion that properties to the south are presumed to be hydrogeologically up-gradient of the subject property. The adjoining properties to the north of the subject property consist of apartment buildings; and townhomes to the east, south, and west. ECS did not identify environmental issues associated with current occupants or activities at adjoining or nearby properties that are believed to present a recognized environmental condition (REC) at the subject property.

According to historical research, the subject property was agricultural land from at least 1936 until the subject property was developed with the current improvements in 1940. The surrounding area has developed slowly from primarily undeveloped agricultural land to residential land over time. A residence was located to the west of the subject property in the 1920s and 1930s until apartments were developed to the north, east, and west in the 1940s. Additional apartments were developed to the south and east in the 1980s. No obvious indications of RECs were identified in the historical data review.

A regulatory database search report was provided by Environmental Data Resources, Inc. (EDR). The database search involves researching a series of Federal, State, Local, and other databases for facilities and properties that are located within specified minimum search distances from the subject property. The subject property was identified on the Facility Index System (FINDS) database as Alexandria Apartments at 3908 Elbert Avenue. The subject property was listed on the FINDS database due to its listing on the Aerometric Information Retrieval System database. According to

the EPA Compliance and Online History database, the subject property is not listed with any related violations. Based on the absence of reported violations, ECS does not consider issues associated with this listing likely to result in a REC for the subject property.

The EDR report identified several off-site properties within the minimum ASTM search distances. Based on our review of reasonably ascertainable public records, ECS does not consider the offsite listings to be potential sources of soil, groundwater, or vapor impact to the subject property. Therefore, ECS does not believe that the off-site listings would have issues that result in RECs for the subject property.

10.2 Significant Data Gaps

ASTM E1527-21 defines a "*data gap*" as: "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." A "*significant data gap*" is "a data gap that affects the ability of the environmental professional to identify a recognized environmental condition." Significant data gaps that would be expected to impact our ability to render a professional opinion concerning the subject property were not identified.

10.3 De Minimis Conditions

ECS did not identify *de minimis* conditions associated with the subject property during this assessment.

10.4 Conclusions

We have performed a Phase I Environmental Site Assessment in general conformance with the scope and limitations of ASTM E1527-21 of the Elbert Apartments Property located at 3908-3916 Elbert Avenue in Alexandria, City of Alexandria, Virginia, the subject property. Any exceptions to, or deletions from, this practice are described in Section 2.6 of this report. This assessment has revealed no evidence of recognized environmental conditions, controlled recognized environmental conditions, or significant data gaps in connection with the property.

RE: CLI Elbert Avenue Residences

Dear Travis:

This is in regard to your letter dated February 23, 2025 requesting to meet the Alexandria Water Quality Volume Default (WQVD) in a Resource Management Area per Article XIII, Section 13-109(E)(6) by treating 82 percent of the WQVD in the project area(s) through stormwater quality controls (structural BMPs) and by participating in the City's Water Quality Improvement Fund (WQIF). You have requested to pay a fee in lieu of providing an onsite BMP as outlined in Article XIII, Section 13-110(A)(2). You have agreed to provide a total monetary contribution of $10,874 (5,437 square feet of impervious surface x $2/square foot). This represents 100 percent of the overall WQVD left untreated.

Your request has been approved. The procedure now is to scan your request letter onto your final plan on a sheet that is labeled Stormwater Facility BMP Details or something similar. Your final plan will be eligible for approval when you have paid the fee ($10,874). The approval of the plan (with your request therein) will act as the approval of your request.

Re: CLI Elbert Avenue Residences

Dear Mr. Pellitteri,

This letter shall serve to request an equivalency option under section 13-110(A)(2) of the municipal zoning ordinance to provide a monetary contribution to the Alexandria Water Quality Improvement Fund in lieu of treating the default water quality volume on site.

Due to site constraints a small amount of impervious area for the site cannot be captured and treated. The post development impervious area for the site is 30,939 sq. ft. and 25,288 sq. ft. will be captured and treated and the site will comply with all requirements for phosphorus removal. However, 5,651 sq. ft. (approximately 18%) of the post-development impervious area cannot be captured. The applicant therefore requests to pay into the Alexandria Water Quality Improvement Fund for this untreatable area.

The uncaptured area includes 5,651 square feet of impervious surface and equates to a required fee of $11,302 ($2/sq. ft.).

Should you have any questions or require additional information, please feel free to contact me at 703-532-6163 or via email at tbrown@wlpinc.com.

GREEN BUILDING NARRATIVE:

GREEN BUILDING CERTIFICATION CONSIDERED: EARTHCRAFT MULTI-FAMILY GOLD PER CITY OF ALEXANDRIA 2019 GREEN BUILDING POLICY. MINIMUM PERFORMANCE POINTS FOR CERTIFICATION IN THE AREAS REQUIRED BY THE CITY'S GREEN BUILDING POLICY WILL BE PROVIDED.

ENVIRONMENTAL SITE DESIGN: SEE CIVIL DRAWINGS FOR ADDITIONAL INFORMATION. IN SHORT, WE ARE EXPLORING THE USE OF VARIOUS BIORETENTION STRATEGIES THROUGHOUT THE PROJECT:

- DRAINAGE FROM A PORTION OF THE ROOF WILL BE COLLECTED BY AN URBAN BIORETENTION FILTER (PLANTER BOX)
- A PORTION OF THE ROOF WILL BE PROVIDED WITH "GREEN SCAPE" PLANTERS OR SIMILAR
- UNDERGROUND FILTERING AND DETENTION STORAGE SYSTEMS (BMP) WILL BE PROVIDED
- SITE AND BUILDING DESIGN HAVE BEEN ADAPTED TO PRESERVE EXISTING TREES ALONG ELBERT AVE.

BUILDING MASSING AND ORIENTATION: THE PROPOSED BUILDING IS ORIENTED AND MASSED TO MAKE THE MOST EFFICIENT USE OF THE SITE AND MINIMUM BUILDING VOLUME. THE EXISTING AT-GRADE PARKING HAS BEEN REDUCED AND MOVED UNDER THE BUILDING FOOTPRINT REDUCING ITS IMPACT ON THE OVERALL IMPERVIOUS AREA. THIS CENTRAL COVERED PARKING AREA PROVIDES A SECOND FLOOR COURTYARD THAT REDUCES THE IMPERVIOUS AREA, CONTRIBUTES TO OPEN SPACE, AND PROVIDES AN AMENITY FOR RESIDENTS.

ENERGY USE: ENERGY STAR QUALIFIED COOLING EQUIPMENT, BATH FANS, AND OTHER HIGH EFFICIENCY EQUIPMENT WILL BE USED TO REDUCE ENERGY USAGE. LED LIGHTING WILL BE UTILIZED TO THE EXTENT POSSIBLE TO REDUCE ENERGY USE. ELECTRIC VEHICLE CHARGERS WILL BE PROVIDED IN THE PARKING AREA TO INCENTIVIZE EV USAGE. COVERED BIKE STORAGE WILL BE PROVIDED TO INCENTIVIZE BIKE USAGE. AT THIS TIME, THE PROJECT TEAM IS NOT CONSIDERING PROVIDING SUPPLEMENTAL RENEWABLE ENERGY SOURCES DUE TO COST AND THE LIMITED ROOF AREA AVAILABLE, BUT THESE TECHNOLOGIES MAY BE CONSIDERED IN THE FUTURE.

COMMISSIONING: COMMISSIONING IS NOT REQUIRED PER EARTHCRAFT MULTI-FAMILY GOLD. REQUIRED COMMISSIONING PER CURRENT VIRGINIA BUILDING CODE WILL BE PROVIDED.

METERING STRATEGY: ELECTRIC METERS WILL BE PROVIDED FOR EACH UNIT. ADVANCED METERING IS OPTIONAL PER ALEXANDRIA 2019 GREEN BUILDING POLICY.

WATER:SEE LANDSCAPE DRAWINGS FOR PROPOSED PLANTS. NATIVE PLANTINGS WILL BE PROVIDED TO THE LARGEST EXTENT POSSIBLE TO MINIMIZE OR ELIMINATE THE NEED FOR IRRIGATION. AS NOTED PREVIOUSLY, RAINWATER FROM A PORTION OF THE ROOF IS PROPOSED TO BE DIRECTED TO BIORETENTION FACILITIES. WATERSENSE QUALIFIED FIXTURES AND OTHER LOW FLOW FIXTURES WILL BE USED TO REDUCE INDOOR WATER CONSUMPTION.

INDOOR ENVIRONMENTAL QUALITY: IN ORDER TO INCREASE DAYLIGHTING, WE HAVE MAXIMIZING WINDOW AREA FOR NATURAL LIGHT. WE ARE ALSO EXPLORING VARIOUS INSULATION MATERIALS AND DETAILS TO IMPROVE THE BUILDING ENVELOPE AND OVERALL INDOOR ENVIRONMENTAL QUALITY. MINIMUM MERV 8 FILTERS WILL BE PROVIDED TO FILTER INDOOR AIR. LOW VOC PAINT AND MATERIALS WILL BE UTILIZED.

INDOOR ENVIRONMENTAL QUALITY:

- THERE ARE NO REQUIREMENTS FOR A DAYLIGHT ANALYSIS REGARDING THIS PROJECT ACCORDING TO ALEXANDRIA'S 2019 GREEN BUILDING POLICY.
- THE PROJECT WILL BE MONITORED AT ALL KEY STAGES OF CONSTRUCTION TO VERIFY THAT BEST MANAGEMENT PRACTICES ARE PRESENT IN THE FOLLOWING AREAS:
  - INSTALLATION OF CLEAN, UNCONTAMINATED PRODUCTS
  - APPROPRIATE MOISTURE CONTENT IN ASSEMBLIES AND COMPONENTS ACCORDING TO INDUSTRY STANDARDS
  - ALL INSTALLED STRUCTURAL PLYWOOD MADE WITH MOISTURE-RESISTANT ADHESIVES
  - HVAC BOOTS, GRILLES AND ROUGH-INS WILL BE COVERED TO PREVENT POLLUTANTS FROM ENTERING SYSTEM
- LOW/NON-EMITTING COMPOSITE WOOD, INTERIOR FINISHES, ADHESIVES AND INSULATION MATERIALS WILL BE UTILIZED.
- THERMAL COMFORT WILL BE CONSIDERED IN THE PERFORMANCE OF ACCA MANUAL J/S SIZING AND EQUIPMENT SELECTION BASED UPON ASHRAE 62.2 STANDARD.

PASSIVE DESIGN STRATEGIES: SEE LANDSCAPE DRAWINGS FOR PROPOSED PLANTS. PROPOSED PLANTS INCLUDE DECIDUOUS TREES TO PROVIDE SHADE IN THE SUMMER AND ALLOW SOLAR HEAT GAIN IN THE WINTER. ALL UNITS WILL INCLUDE OPERABLE WINDOWS TO ALLOW FOR PASSIVE VENTILATION.

GENERAL NOTES:

1. DRAFT EARTHCRAFT CHECKLIST INCLUDED IN THIS SUBMISSION. ENERGY PERFORMANCE ANALYSIS AND UPDATED CHECKLIST TO BE PROVIDED WITH BUILDING PERMIT.
2. EARTHCRAFT REGISTRATION REQUIRES GC INFORMATION. OWNER IS IN THE PROCESS OF SECURING A GC AND WILL PROVIDE THE NECESSARY CERTIFICATION DOCUMENTATION UPON COMPLETION.
