Right now there is 11.7 feet on the left side of the building; your drawing needs to demonstrate actual numbers that show a minimum of five feet clearance on the left side of your trailer.

Yes I am telling them it is 6 feet long so $11.7 - 6 \text{ feet} = 5.7$ right? Also having someone do this will cost me 1200

That's not what you're showing, because it doesn't look like the trailer is next to the building – it looks like it could be several feet away. That's why we need a dimensioned, to scale drawing.

Preferably have the whole thing properly dimensioned

Is this better?

The width between edge of building and property line is 11.7'.

The space
between trailer
and property
line is 5.7'

Trailer 12
feet long
